ABSTRACT

This research effort involves a comparison between the actual repair parts demand data generated by the forklifts at Naval Supply Center, Oakland, California, during calendar year 1975 and the allowance quantities of the applicable allowance parts lists (APL's). The comparison is accomplished from three perspectives: the first perspective evaluates the degree of correlation between line items demanded and the line items appearing in the APL's; the second perspective provides a projection of the effect of increased forklift operating hours on the quantities demanded among those demands for line items allowed by the APL's; and the third perspective identifies those line items for which demand generated rendered the quantities demanded significantly different from the quantities allowed by the APL's. As a result of these comparisons and the low correlation between demand data and allowance projections, it is hypothesized that the crucial variable contributing to this low correlation is the low utilization of the equipments in terms of annual operating hours. The conclusion reached is that APL's for forklifts, as presently formulated, are a support planning document of dubious value in situations of low equipment utilization such as observed in this study.

I. INTRODUCTION

A. PURPOSE OF RESEARCH

For a number of years the author was stationed at activities at which he was a principal benefactor of the materials handling capabilities of forklift vehicles and for which equipments he was responsible for the repair parts support. Invariably the author experienced difficulties and frustrations of varying degrees in attempting to establish an optimal forklift repair parts support position locally and, it seemed, the allowance parts lists were either nonexistent or not very helpful in the particular situation. Harking back to these earlier experiences, the author set about this research effort to learn for himself what it was about the allowance parts lists that had not lived up to his expectations. Now, removed from the personal and professional attachment to a group of sometimes marvelous, sometimes cantankerous machines, the author has attempted to objectively evaluate his hypothesis that the forklift allowance parts lists are not what they should be in terms of accuracy and reliability as a support planning document. The author admits to having entered this study with considerable bias, much of which has been dispelled as a result of this effort, but the author believes that his research has unearthed the possibility that allowance parts lists for forklifts could be substantially improved by the inclusion of the variable of operating hours in parts usage projections.

B. BACKGROUND

It was not until World War II, when the U.S. Navy used fork-lift trucks to perform prodigious feats of loading and unloading battle cargo, that U.S. industry woke up to the fact that it had been squandering its manpower by doing most of its lifting by hand [17].

The U.S. Navy continues to accomplish staggering volumes of material handling with its extensive inventory of fork-lift vehicles as do also the other military services. By virtue of its unique combination of mobility and lift capability, the forklift vehicle in its varied forms provides an extensively adaptable capability possessed by no other form of materials handling equipment. The flexibility of the forklift makes it the single most vital equipment in our general cargo handling endeavors both ashore and afloat, and our reliance upon it is unlikely to diminish for so long as U.S. foreign policy and military strategy dictate the operation of large military installations abroad, the continuous deployment of U.S. Navy vessels on all the oceans of the world, and the massive support installations necessitated within the United States. In essence, for so long as the United States maintains the capability and readiness for waging a prolonged war involving less than nuclear obliteration, it will require the on-going maintenance of a far-flung logistics effort of tremendous magnitude to make this strategic alternative a credible reality. Such a logistics effort is and will continue to be largely facilitated by the versatile forklift.

The author served for eighteen months in Danang, Vietnam, during 1968-1969 during which time his duties involved extensive reliance on forklift vehicles as well as intensive efforts to develop local stocks of repair parts in support of a variety of types of forklifts. In the latter effort, the author experienced numerous frustrations which, although usually met with plausible explanations, nonetheless left this writer with a vague sense of inadequacy in some aspects of repair parts provisioning for forklift vehicles. The author has subsequently mellowed in his assessment of the causes of the forklift repair parts deficiencies at that time, and he is now more conscious of the severe environmental conditions present, the abusive equipment operating practices, and the uniqueness of the Vietnam War itself which rendered past repair parts usage data largely inapplicable. Nonetheless, the author's curiosity about the adequacy of such repair parts planning has persisted and has led to this research effort.

Logically, or so it would seem, the proper starting point for such a research effort should begin with the identification of an activity having a significant population of forklift vehicles, the identification of those vehicles, and the identification of the applicable allowance parts lists. The Naval Supply Center (NSC), Oakland, California, provided a seemingly perfect place to conduct such an analysis in that a large number of forklift vehicles were in use there, thus minimizing the probabilities of a single machine having such

extreme parts requirements that it would skew all the parts utilization data for all equipments from a normal pattern. As will be seen later, however, the large numbers of fork-lifts posed a different problem in that there undeniably exists an abnormally low annual operating rate on the average per equipment which manifests itself in the form of low parts usage rates. Although this pattern was not recognized initially, upon becoming aware of this low parts usage rate, the author elected to continue his research in the belief that over-provisioning in a low parts utilization situation is as economically inefficient as under-provisioning is ineffective in a situation of high parts utilization; hence, the author believed that whatever his findings, there existed the potential of revealing some information of use.

Having identified the activity and its forklift equipments, the author embarked upon an effort to identify the applicable allowance parts lists (APL's). In this effort the author was invaluablely assisted by the Navy Ships' Parts Control Center (SPCC), Mechanicsburg, Pennsylvania, the Navy activity cognizant over the preparation of allowance parts lists for all such material handling equipments (MHE). Personnel at SPCC conducted an interrogation of their computer data bank by respective USN identification number of all 421 forklifts on the NSC Oakland MHE allowance. The output of this interrogation revealed that a total of 130 of the forklifts were specifically covered by 18 different allowance parts lists, the remaining 291 forklifts on the NSC Oakland allowance having never had APL's developed in their support.

The revelation that less than one-third of the forklifts on the NSC Oakland allowance had been provided with a formal support document prompted the author to inquire into the policy, if a policy indeed existed, concerning the preparation of APL's for MHE assets. Conversations with knowledgeable individuals at both the Naval Supply Systems Command (NAVSUP) and at SPCC indicated that whereas there had always been a consistent policy of preparing APL's for forklifts employed aboard ship and at overseas activities, the same had not been true of MHE assigned to U.S. shore installations. The explanation for the sporadic preparation of APL's for shore-based MHE was twofold:

- (1) there has existed a communication and/or coordination problem such that much of the MHE formerly procured by the Defense Supply Agency (DSA) was not always referred to SPCC for APL development whereas most MHE purchased by or authorized for purchase by NAVSUP was so referred; and
- (2) there has existed the belief that U.S. shore activities could and would find it advantageous to obtain much of their MHE repair part requirements from local commercial sources. This situation has prevailed until slightly more than two years prior to this writing. Although there appears to have been no new policy statement formally generated, there does presently exist the tacit understanding that APL's will be prepared for all MHE acquired for U.S. Navy use ashore or afloat provided such acquisitions are

communicated to SPCC for action. Just how this communication is to take place is not clear to the author as he was unable to ascertain whether or not any channels or procedures had been established to facilitate this crucial first step. Nonetheless, the intent appears to be directed toward increased development of APL's for MHE.

The origin of APL parts usage projections for forklifts is interesting, if not sophisticated. Essentially, the burden for determining which repair parts and in what quantities to include in the APL's resides with the contractor from whom the forklifts are purchased. The contractor submits an estimate of ninety days parts usage as an initial outfitting of repair parts in support of the equipment he is supplying. This list is reviewed by NAVSUP with consideration being given both to the adequacy of the outfitting and also to the financial implications inherent in such support documents. This edited outfitting list is passed to SPCC in the form of a lead allowance parts list from which an APL is developed.

In the author's opinion, the significant weakness in this procedure of APL development lies not in the procedure itself, but rather upon the ninety day endurance criteria upon which the APL's are based. It would appear that the customary ninety day time frame has been invoked for use in conjunction with MHE as it is in most other Navy-owned equipments for which APL's are developed.

In this paper the author expects to demonstrate the inseparable relationship between equipment operating hours

and requirements for repair parts on forklifts such that creation of a repair parts allowance support document based solely on a ninety day endurance level but without regard to the variable of operating hours can result in less than optimal inventory and inventory funds management. It is the author's belief that there exists a high degree of correlation between repair parts usage, especially those parts normally replaced during periodic preventive maintenance actions, and equipment operating hours. Indeed, there would appear to be considerable support for this line of reasoning both among the major manufacturers of forklifts as well as among various Navy commands cognizant over some aspect of forklift reporting and accounting. In the first instance, many, if not all, forklift manufacturers prescribe in their parts and service manuals certain periodic maintenance actions to be performed on the equipments and the intervals between these maintenance actions are usually specified in terms of operating hours. Secondly, the Naval Supply Systems Command seems to support this position in NAVSUP Instruction 10490.32 from which the following excerpt is taken:

Each activity must establish a preventive maintenance program, appropriate for local operating conditions, which will encompass . . . a planned program of periodic inspections and maintenance based on actual vehicle or equipment operation as measured by an equipment mounted recorder [27]

In addition, this instruction continues its use of operating hours as a measure of equipment wear by providing a table containing the projected maximum economical utilization of MHE in terms of years which are in turn equated to cumulative operating hours per equipment and yield an expected life based on twelve hundred hours of operation per year. The Navy Comptroller (NAVCOMPT) would appear to substantiate these equipment life expectancies in that NAVCOMPT guidelines for computation of equipment depreciation, when such is appropriate, cite the same number of years over which to charge the depreciation as the years provided by NAVSUP in defining maximum economical utilization of MHE [3].

One further instance of Navy use of operating hours to gauge the degree of equipment utilization is provided by SPCC in its instructions to activities having MHE with regard to the submission of data to SPCC in the Annual Report of Materials Handling Equipment. At the end of each calendar year, activities having MHE report the actual cumulative operating hours for each equipment and, for the year just completed, report the actual operating hours for the year as a percentage of two thousand operating hours [4].

The author has dealt at length with the matter of operating hours as a measure of equipment use and wear because they will be used later in the development of the comparison between actual repair parts usage and APL projected parts usage. What matters is that there is formal recognition given to operating hours in certain reporting requirements on

equipment usage, although applied standards of operating hour-years vary from 1200 to 2000 hours, depending on the command involved.

C. SOURCES OF DATA UTILIZED

1. Repair Parts Usage Data.

The forklifts and other automotive assets belonging to NSC Oakland receive their maintenance from the transportation maintenance section of the Public Works Center (PWC), San Francisco Bay Area, Oakland, California. While the PWC headquarters are located at nearby Oakland Army Base, the PWC transportation maintenance section is situated within the confines of NSC in a building shared with the Supply Center's Labor and Equipment Division under whose cognizance NSC's MHE falls. The author drew upon the retained records of the PWC transportation maintenance section to collect the actual repair parts usage data experienced by NSC Oakland's forklifts during 1975. The records were of two types depending on the nature of the transaction involved. The first set of records consisted of Material Requirements/ Issue Documents (NAVFAC Form 9-11014/8) which contained history data for all parts ordered from commercial sources under the purchasing authority of various Blanket Purchase Agreements (BPA's). The second set of records consisted of Material Issue Lists (12ND PWC Form 7323/1) which reflected those items issued over the counter from the PWC transportation maintenance section shops store. The shops store carries an inventory of approximately 2000 line items of various

automotive components and is stocked using Navy Industrial Funds (NIF). The items carried in inventory by the shops store are both standard and non-standard stock items, that is, they have been obtained from both the Navy Supply System and commercial sources and therefore are identified to National Stock Numbers (NSN's) and local stock numbers respectively. To permit identification of the method of supplying the parts requirements at the time they were generated, use of an "I" for shops store issues and use of an "O" for BPA order actions is indicated throughout the appendices under the "Act" (Action) column.

Both the Material Requirements/Issue Document (MRI) and the Material Issue List (MIL) call for the use of both the accounting job order number to be charged and the equipment USN number for which the requirement is being obtained. By and large, these two pieces of information were present on the documents even though throughout Fiscal Year 1975 either piece of information would suffice to identify the equipment for which the part was being sought. This was true because each USN numbered equipment was also given a unique accounting job order number. Commencing with Fiscal Year 1976, however, job order numbers were assigned only for each equipment cost code as defined by NAVCOMPT. Consequently, in the few instances when USN numbers were not annotated on the MRI's and MIL's, it was impossible to assign the required part to a specific equipment and, hence, the data was discarded.

The author relied largely on the julian dates of the transactions to ascertain whether or not the parts usage data was rightfully to be included among the data generated during the year 1975. Nonetheless, requirements generated early in 1975 and early in 1976 were reviewed by Shop Repair Order numbers (SRO numbers) to ascertain whether or not the requirement was associated with an equipment maintenance action which had commenced in one year and had carried over into the following year. Those items ordered early in 1975 for equipments on which maintenance had commenced in late 1974 were excluded from the parts usage data and, by the same token, those items ordered early in 1976 for equipments on which maintenance had commenced in late 1975 were included in the parts usage data. This policy was employed based on the reasoning that more important than the date of actual material ordering was the date in which the parts failures had caused the equipment to be brought into the shop for maintenance and repair.

Following his collection and organization of the parts usage data, the author screened all items having National Stock Numbers against a current Navy Management Data List in order to identify and rectify possible transposition errors which had occurred in his data recording process or which had been entered incorrectly on the original order documents. Subsequently, for those equipments having assigned APL's, the author attempted to cross to National Stock Numbers all requirements having only part number identification.

2. Forklift Identification and Operating Data.

The author relied on the DOD Property Records (DD Form 1342) contained in the equipment history jackets for specific identification of the make, model, year, capacity, and manufacturer of the NSC Oakland forklifts. The information was then compared with the manufacturer, year of manufacture, and capacity indicated in the Annual Report of Materials Handling Equipment generated by SPCC. Discrepancies were resolved in favor of the data contained in the SPCC report as this information had been provided by the contractor who supplied the equipment to the Navy. All but the year of manufacture is indicated in the appendices and a key to the manufacturer and model codes can be found immediately prior to Appendix A.

The operating hours of each forklift were derived by taking the difference between the cumulative operating hours reported on the Annual Report of Materials Handling Equipment at the end of 1975 and the figure reported the previous year.

As indicated previously, identification of the applicable APL's was accomplished through individual equipment USN number interrogation of SPCC's data bank. In that all the forklift APL's are identified to nine digit numbers commencing with "95000," the last four digits are significant in distinguishing between APL's. These four digits appear in the appendices when applicable and indicate those parts requirements generated by forklift vehicles governed by a particular APL.

II. SCOPE OF THE DATA

Equipments included in the study consists of the 421 forklifts which comprise the NSC Oakland allowance for such vehicles. Although the PWC transportation maintenance section performs maintenance on forklifts belonging to activities other than NSC, the author chose to limit his research to the NSC assets both because there appeared to be more than enough parts usage data to support a study of this nature and because other data such as equipment operating hours was known to be available.

Of the 421 forklifts considered, 130 of them have APL's assigned. Within this group of 130 vehicles, parts usage data was generated by 115 equipments during 1975. Among the 15 vehicles experiencing no repair parts requirements were all 5 vehicles for which APL 950004230 is applicable, all 4 vehicles for which APL 950002612 is applicable, and the single vehicle for which APL 950004202 is applicable. Collectively, these 10 forklifts accumulated 3,209 hours of operating without a parts replacement being necessitated. The remaining 115 forklifts provisioned by 15 APL's generated 1,244 demands for 386 line items while operating a total of 61,482 hours during 1975. The 130 forklifts averaged 497.6 hours of operation for the year.

The 291 forklifts on the NSC Oakland allowance not supported by APL's logged 115,237 hours of operation during 1975 for an average of 396.0 hours per equipment. Repair parts were required by 245 of these vehicles during the year, the remaining 46 forklifts having no parts replacement actions during that time. A total of 2,831 parts demands encompassing 916 line items were generated by the 245 vehicles.

Collectively, then, the 421 forklifts operated a total of 179,928 hours for an average of 427.4 hours per vehicle. Had the same number of forklifts operated at the NAVSUP standard level of 1200 hours per year, they would have logged 505,200 total hours; at SPCC's standard of 2000 operating hours per year, they would have amassed 842,000 total hours. Relative to these two operating standards, therefore, the NSC Oakland forklifts were utilized at 35.6 percent and 21.4 percent capacity, respectively.

One cannot state that the level of utilization of NSC Oakland's forklifts is indicative of excess capacity based solely on the undeniably low percentage of utilization when compared with NAVSUP and SPCC standard operating hour-years. To do so would not give adequate recognition to the immensity of the physical facility of NSC Oakland and the necessary dispersion of forklifts about that installation at various working areas, some of which undoubtedly have small but repetitive requirements for the services of forklifts. Nonetheless, an excess forklift capability is evident and to rectify that situation NSC Oakland has requested disposition instructions for 45 forklifts.

The author cannot leave the subject of standard operating hour-years without attempting to place these standards in perspective relative to NSC Oakland. Subsequent to the withdrawal of the United States and its involvement in South-east Asia, the Naval Supply Center Oakland experienced a substantial tapering off of business levels. Hence, the resultant excess forklift capability and the associated low usage rates of the assets. Presently, NSC Oakland operates a single shift, forty hour week in most of its functional areas with a minimal number of employees working a swing shift in a few areas. Use of forklifts by this swing shift is so insignificant as to not warrant consideration in a discussion of the operating hours performed by MHE assets at that activity. This being the case, the SPCC standard operating hour-year of 2000 hours appears unrealistically high in that it implies continuous operation of each equipment throughout the entire eight-hour workday each and every day of the workweek for the entire year. On the other hand, the NAVSUP standard operating hour-year of 1200 hours appears to be reasonably achievable at an activity such as NSC Oakland at which a single shift is the rule. In this case, a forklift would need to operate an average of 4.8 hours out of every eight-hour workday to accumulate 1200 hours of operation per year. No doubt there is some quantity of forklifts which would average operating at this rate at NSC Oakland were the volume of material handling to remain reasonably constant. It is not the intent of this paper to

propose that such a forklift population be determined and then implemented; rather, it is the author's intention to suggest a reasonable standard of operating hours against which normal equipment wear might be correlated with repair parts usage. It would appear that the NAVSUP standard operating hour-year would possibly meet this objective reasonably well.

III. PRESENTATION OF DATA

A. METHOD OF COMPARISON OF USAGE DATA AND APL PROJECTIONS

Using a manual review method, the author attempted to equate each and every item of actual parts usage data to a corresponding part in the APL. The author makes no claim to expertise as a forklift mechanic, yet he does possess a working familiarity with automotive mechanical systems in vehicles having internal combustion engines. In those instances where the author possessed certain knowledge of the system within which a specific repair part would logically be included in the APL, he reviewed that accessory APL first. Locating the corresponding item or an interchangeable item therein (the author's policy of ascribing interchangeability will be described shortly), the author concluded his effort to find a match for the repair part in question. Failure to find a match in one accessory APL led to a search of all the accessory APL's, if necessary, until a match was determined to exist or not to exist. Although tedious, this screening procedure was exhaustively conducted for every item of actual usage data for a given APL, the writer reviewing both the primary identification numbers in the APL's and also the multi-reference numbers in an effort to find a match. In the event that the item of usage data had no match in the

APL, the author then determined within which system the demand should be reflected, if it was within his scope of knowledge to do so. Certain items of a general nature such as gaskets and ball bearings which were not specifically found in the APL almost consistently defied assignment to a specific system and hence were recorded as demands for items not allowed by the APL but not charged to a specific system of the equipment.

The author attempted to ascribe as much of the actual parts usage data to a corresponding item allowed by the APL as he possibly could. To achieve this goal, the author took the liberty of ascribing interchangeability by edict when the items were known to him to be like items even though such interchangeability might not be technically correct or formally recognized as such. The author relied on commonality in nomenclature, and group and class designations to assist him in this endeavor. In addition, he utilized the descriptive technical data contained in the Federal Supply Catalogue series to verify the similarity between the allowance listed item and the item being considered as a candidate for interchangeability. The author elected to pursue a conservative policy in ascribing interchangeability, however, in the belief that it was preferable to err on the low side than the opposite, but there were some items such as spark plugs which were virtually automatically assumed as interchangeable because of the distinctly unique nature of the item in any given equipment.

Because of the low hourly operating level experienced by NSC Oakland forklifts, the actual parts demand data typically falls far short of the suggested quantities indicated in the appropriate column of the APL. In many cases, the entire year's demand for a given item falls short of the quantity projected for a ninety day endurance level. To facilitate the production of a meaningful comparison, therefore, the author has utilized three perspectives from which to analyze the data generated by the particular forklifts specifically supported by each of the fifteen APL's.

The first perspective involves a simple line item comparison between the parts actually required by the equipments and those parts allowed by the respective accessory APL's. The author has interpreted the term "allowed" with respect to those items listed in the APL's as only those items having a positive quantity indicated in the appropriate column for the given population of the equipment; hence, those items listed but having no quantity or a zero quantity indicated have been excluded from consideration as "allowed." Part I of Tables II through XVI under the caption "Line Item Correlation Between Usage Data and Accessory APL's" deals with this perspective and makes the following comparisons:

- (1) Against the number of line items allowed in each accessory APL is compared the number of line items which were actually demanded and which have identical stock number (prime number) identification with those items appearing in

the accessory APL; the percentage relationship for this comparison is also shown. This same relationship is indicated showing what percentage of the entire APL allowed line items was demanded on an identical item basis.

(2) The number of substitute or interchangeable line items (substitute allowed line items consisting of those found among the multi-reference numbers and those defined as interchangeable by the author in the manner previously described) demanded within each accessory APL is indicated, and the total number of such substitute line item demands is given for the entire APL.

(3) Against the number of line items allowed in each accessory APL is compared the combined number of identical and substitute line items demanded. (Note that the number of identical allowed line items demanded and the number of substitute line items demanded does not necessarily sum to equal the total APL allowed line items demanded because of instances where the prime number and a substitute number or more than one substitute number was used to obtain the same item on differing occasions.) In addition, the total number of accessory APL allowed line items demanded is expressed as a percentage of the number of line items allowed within each accessory APL. This same relationship is also indicated collectively for the accessory APL's giving the total number of APL allowed line items demanded from among the allowed line items comprising the entire APL.

(4) The number of non APL allowed line items experiencing demand within each accessory APL is indicated for the respective accessory APL's as well as a collective total of these figures for the entire APL. The non APL allowed line items demanded consist of those items believed by the author not to have been listed in the APL and for which demand was generated. In the case of the majority of the line items categorized as not APL allowed the author has no doubt but that this is indeed accurate, but because of his conservative approach to ascribing interchangeability there exists the possibility that some of these items could have been correctly considered as substitute items for those indicated in the APL.

Although admittedly somewhat tenuous in terms of assumptions made, the second perspective makes comparisons between the APL allowed quantities and manipulated quantities of those allowed line items actually demanded. The process utilized in the manipulation of actual quantities demanded involves smoothing of the actual demand over the period of the year by taking the total quantity of the line item demanded during the year and dividing that quantity by four with no regard whatsoever being given to the dates and quantities involved in the individual transactions comprising the total year's demand for any given line item. This quartering of the annual demand permits a ready comparison with the APL allowed quantities by placing both the APL

quantity and the demanded quantity within a common, ninety day time interval. This smoothed demand data is then compared with the APL allowed quantities on three levels. The first level is a direct comparison between the smoothed quantity demanded and the APL allowed quantity, the results being expressed in terms of the smoothed quantity demanded being either less than or greater than or equal to the APL allowed quantity. By virtue of the fact that the smoothed quantity demanded was derived from actual annual quantities demanded, this smoothed quantity is likewise based upon the actual operating hours performed by the equipments which generated the demand data.

To perform the second and third levels of this comparison, the actual equipment operating hours have been averaged among the equipments comprising the population governed by the specific APL. This average operating hour figure is then related to the NAVSUP standard of 1200 operating hours per year and the SPCC standard of 2000 operating hours per year by expressing these relationships as the ratios between 1200 operating hours per year and the actual averaged operating hours for the year and likewise between 2000 operating hours per year and the actual averaged operating hours. The smoothed quantity of the line items demanded is then multiplied by these ratios, the products again being compared to the APL allowed quantity and the results of the comparison again being presented as the smoothed quantity demanded (accelerated by the respective

ratios) being either less than or greater than or equal to the APL allowed quantity for each line item.

Perhaps an example would best serve to clarify the process just described. Suppose the APL allowed quantity for a given line item is 1 (understand, of course, that this is a ninety day endurance quantity of that item). Suppose that this particular line item is demanded twice during the year by two of the six forklifts supported by the APL involved, each demand being for 1 each, the total demand for the year for the item thus being 2. Further suppose that the six forklifts operated a total of 2,400 hours during the year thus averaging 400 operating hours per equipment. Smoothing of the year's total demand of 2 yields a quarterly quantity demanded of .5, a quantity which is based on the actual operating hours performed by the six forklifts. When compared to the APL allowed quantity on the first level, .5 is seen to be less than the allowance quantity of 1 and is thus recorded as such. On the second level, however, the NAVSUP standard equipment operating year of 1200 hours is found to be a ratio of 3 times the actual equipment operating hour average of 400 hours. Multiplying the smoothed demanded quantity of .5 by the ratio of 3 yields a projected smoothed demanded quantity of 1.5 which, when compared to the APL allowed quantity of 1, is reported as greater than the APL allowed quantity. Likewise, on the third level the SPCC standard equipment operating year of 2000 hours yields a ratio of

5 times the actual equipment operating hour average of 400 hours. When this ratio of 5 is multiplied by the smoothed demanded quantity of .5, the resulting product of 2.5 is again seen to be greater than the APL allowed quantity of 1 and is thus reported as such.

The second perspective, therefore, can be seen to be an extrapolation of the actual line item demanded quantity with operating hours treated as an independent variable and with quantity demanded as a dependent variable behaving in a proportionate manner with respect to increases in operating hours. The author acknowledges the tenuous nature of the assumption underlying projections of this sort because it is probably unreasonable to expect demand data to accrue in such predictable increments. Nonetheless, it would be illogical to deny that parts usage incurred in a lesser timeframe would normally show increases in quantities over a greater timeframe (ultimately, of course, for some given period of time all parts could be expected to incur sufficient wear to require replacement). In view of the undeniable relationship between time and parts usage, therefore, the author deems the projections of quantities demanded as a function of time (operating hours) to be warranted even if there exists a known risk of imprecision in the results. These projections are presented in Part II to Tables II through XVI under the caption "Projected Effect of Increased OP Hours on APL Allowed Line Items Demanded Qty."

Before leaving the subject of the perspective two analysis, two comments appear to be in order. First, the author acknowledges that it is highly probable that some, perhaps many, of those line items which experienced no demands during the shorter timeframe consisting of the actual equipment operating hours would experience some level of demands over a greater timeframe such as the time represented by the 1200 or 2000 hour operating standards. The absence of any demands for these items over the short run, however, obscured any potential demand pattern over the long run and, hence, the demand for these items was arbitrarily held to zero in the projections made. This arbitrariness on the part of the author will hopefully not trouble the reader, for it is the author's intention merely to establish a relationship between time (operating hours) and quantities demanded, not to prescribe suggested allowance quantities for each and every APL line item based on this work.

The second comment which the author wishes to make concerns the inherent pitfalls associated with smoothing the quantity demanded in the manner indicated. The author does not wish to diminish the importance of the relationship between frequency of demands and quantities demanded. To do so would be to ignore the fact that many maintenance actions, at whatever intervals they occur, typically require a multiple quantity of a particular part or parts on a single occasion. An engine tune-up is one such example in which all four or all six (depending on engine size) spark plugs are typically

replaced. An overhaul of an internal combustion engine is another case in point wherein all four or all six pistons and associated parts are frequently replaced at one time. By and large, the various APL's seem to take this multiple quantity requirement into account for most such items, at least so it appears as judged from the standpoint of the actual demand data matched against such APL allowed items. One striking example exists, however, wherein the APL's typically do not take into account the pattern of multiple quantity requirements for an item on a single occasion. This situation is frequently found in APL allowed quantities for tires, especially when the indicated allowance quantity governs a small population of equipments. Usually the APL allowance quantity in such situations is indicated as one, but the actual demand data for tires shows that a quantity of two is usually ordered on any given occasion. This pattern prevails not only because the tires on the front or the rear of the vehicle wear out at approximately the same rate, but also because to mount a new tire on one end of an axle while retaining a substantially worn tire on the other end can create vehicle steering problems, as well as posing potential difficulties in load-balancing and causing undue stress damage to the axle.

The author has cited the foregoing examples as an indication of his awareness of such multiple quantity requirements and their importance. Nonetheless, because of the extremely small quantities demanded and the infrequency of

the repair parts demands generated by the forklifts at NSC Oakland, smoothing of quantities demanded presented itself to the author as the method yielding the most meaningful basis for comparison of actual demand data and allowance quantities. When evaluated over any increment of ninety days, actual demands for most line items almost never resulted in quantities demanded which consistently approached or exceeded the APL indicated allowance quantities, tires being the single notable exception to this situation. True, other line items either through a single demand for an exceptionally large quantity or through an occasional density of demands within a short period of time sporadically exceeded the APL allowed quantities but no recurring pattern was evident in these instances. In addition to the desirable element of a consistent pattern obtainable through smoothing of quantities demanded, this technique has the additional advantage of being easily equated to a measure of time and operating hours. For this reason the author has pursued the use of this method in spite of the inherent failure of this practice to give adequate recognition to items typically ordered in multiple quantities for a single application.

The third perspective is possibly the most revealing of all. The author has smoothed the actual demand data pattern as before for comparison with the ninety day quantities provided by the APL. From this smoothed quantity demanded, the author has evaluated the significance of the difference between the APL allowed quantity and the averaged demand data

quantity. The criteria used to determine the significance of the difference is a product of the author's judgement and is flexible in that it consists of no rigid percentage in the smaller quantity range. This flexible criteria was necessitated by the overwhelming number of APL allowance quantities being one or two units of any given items such that had a significance in difference been defined in terms of a fixed percentage, the criteria would either have been unacceptably tolerant of large differences among those allowance items having substantial quantities allowed or else the criteria would have been unacceptably intolerant of increments of one unit differences between demands and allowance quantities where the latter were small. Only at the point where the allowance quantity is 16 or greater **do** the criteria for determining the significance of the difference settle into a pattern of plus or minus 25 per cent. The resulting criteria for defining a significant difference between demanded quantities and APL allowed quantities are depicted in Table I and the line items having differences thus defined are listed in Part III of Tables II through XVI.

B. COMPARISON OF USAGE DATA AND APL'S

Comparison of the actual repair parts demand data and the APL parts projections has been summarized in Tables II through XVI and, it is believed, will require little elaboration although familiarity with the methods employed in making the comparisons (as described in the preceding section) will

TABLE I

PART IV. GENERAL CRITIQUE OF APL

- (1) APL STRENGTHS: APL is organizationally logical and the accessory APL's are quite adequately comprehensive with the Hydraulic System Group rated as exceptionally comprehensive.
- (2) APL WEAKNESSES: No significant weaknesses noted.

PART IV. GENERAL CRITIQUE OF APL

(1) APL STRENGTHS: None of significance

(2) APL WEAKNESSES:

Very limited support in almost every system group. Particularly weak are the accessory APL's dealing with engine and electrical systems where there are no pistons and no connecting rods provided for, no camshaft or crankshaft parts support, no oil pump, no ignition coil, no distributor, and no regulator.

PART IV. GENERAL CRITIQUE OF APL

- (1) APL STRENGTHS: APL is comprehensive in support provided in all accessory APL's, perhaps too much so for the smaller populations of the equipment supported.
- (2) APL WEAKNESSES: No significant weaknesses noted, but having such limited demand data upon which to base an appraisal renders such an appraisal mostly one stemming from an impression made upon the author.

TABLE IX (CONTINUED)

PART IV. GENERAL CRITIQUE OF APL

- | | |
|---------------------|--|
| (1) APL STRENGTHS: | Extensive support provided for both engine and electrical systems groups. |
| (2) APL WEAKNESSES: | Organizationaly APL seems confused. Items such as water pump, upper radiator hose, radiator, and repair kit for water pump all appear under Engine Group vice Cooling System Group and repair kit carburetor appears under Engine Group vice Fuel System Group. APL would also benefit by having separate group for gages. |

PART IV. GENERAL CRITIQUE OF APL

- (1) APL STRENGTHS: Generally, each accessory APL appears to be adequately comprehensive, especially the Electrical System Group.
- (2) APL WEAKNESSES: None specifically noted, but the author would recommend a separate accessory APL for gages.

PART IV. GENERAL CRITIQUE OF APL

- (1) APL STRENGTHS: Extensive support shown in Hydraulic System Group and in Transmission Group, and generally throughout all the accessory APL's.
- (2) APL WEAKNESSES: No storage battery requirement projected, nor does APL provide support for safety devices such as headlights, tail lights, and horn.

PART IV. GENERAL CRITIQUE OF APL

(1) APL STRENGTHS: An extremely comprehensive APL in each of its accessory sections, the Engine, Fuel, Electrical, Transmission, Brake, and Hydraulic System Groups are exceptionally extensive.

(2) APL WEAKNESSES: No weaknesses noted.

be helpful to the reader in understanding the data presented. At the conclusion of each table are provided some general comments where appropriate regarding strengths and weaknesses of the particular APL being discussed. The comments made are of a general, organizational nature. Use of the statement "No significant weaknesses noted" is not intended to refute the statistical data contained in Parts I through III of the tables as the comments do not concern themselves with the content of the statistical analysis.

There are two situations wherein the author finds his analysis to be less than adequate but, regrettably, unsolvable:

(1) there are several APL's for equipments which generated so few parts requirements that the comparison is necessarily unrevealing; and

(2) with regard to the accessory APL's dealing with hydraulic systems, the demand data presents an inadequate picture of hydraulic hose replacements due to the practice at PWC transportation maintenance section of buying hose material and fittings in bulk quantities and of locally manufacturing individual hoses as required. Due to the substantial variance in lengths of hoses fabricated from any given hose size, the author made no attempt to equate this data either by type hose or by quantity to those hydraulic hose assemblies listed in the APL's. Awareness of these two limitations will hopefully enhance the reader's ability to evaluate the data contained in the following tables.

C. SUMMARY OF DATA PRESENTED

Tables II through XVI and the respective supporting appendices amply attest to the low coorelation which exists between the level of support allowed by the APL's and that which is required in the specific case of NSC Oakland's forklifts. The disparity between the two sets of figures is undeniably substantial. By adding the "Totals" data from Part I of Tables II through XVI it can be seen that the fifteen APL's analyzed in the tables collectively allowed 1,736 line items in varying quantities ranging from 1 or 2 units in most instances to 350 units in the most extreme case. The author recognizes that by totaling the individual APL's he has disregarded the existence of probable redundancy of line items which appear in more than one APL, but he has done so on the basis that the suggested quantities for all the line items appearing in the individual APL's would be cumulative even if for a lesser number of line items. To the 1,736 allowed line items from the fifteen APL's reviewed add the additional quantity of 372 line items allowed by the three APL's covering the ten equipments which, as indicated previously, did not generate any repair part replacement requirements during the year and it is observed that there are 2,108 line items in varying quantities which constitute suggested stocking levels in support of the 130 forklifts involved. Yet of this potentially extensive inventory, only 117 line items allowed were demanded by the

specific prime number identity cited in the respective APL's, only another 245 substitute line items were demanded, for a total of 216 different line items demanded of the 2,108 allowed. These figures represent the totals obtained by summing the "Totals" data of Part I from Tables II through XVI. The reader is reminded that the figure shown as the total of the different line items demanded within each APL is normally less than would be derived by adding the respective total demands for allowed prime number line items demanded and allowed substitute line items demanded due to the occurrence of more than one demand for the same allowed line item; hence, the figure 216 different line items results in an apparent contradiction to the sum which would result from combining the figures 117 and 245. Comparing the 216 different line items demanded with the 2,108 line items allowed, it is seen that barely ten per cent of the APL suggested inventory on a line item basis experienced any stock movement. Moreover, assuming the total number of non APL allowed line items demanded could be determined to be demands for discrete allowed line items, in the best case it can be seen that the 393 demands (total from all fifteen tables) for these items identified by the author as being "Non APL Allowed Line Items Demanded" plus the demands for the 216 allowed line items would result in demands having been experienced by 609 of the 2,108 line items allowed and a consequent movement of only 29

per cent of the suggested stock. In the author's opinion, however, this best possible case is unattainably high in that he is convinced that a majority of the 393 non APL allowed line items demanded are properly identified as not being allowed by the APL's involved. For information, Appendix P indicates that the APL provisioned forklifts collectively generated demands for 386 discrete line items.

Whatever the exact number of distinct line items allowed by the 18 APL's, without some kind of coordinating allowance document similar to a Coordinated Shipboard Allowance List (COSAL), the 18 APL's would still suggest stocking an inventory consisting of a range of items comparable to the number of distinct line items allowed from among all 18 APL's and in a depth comparable to the allowance quantities indicated for each of the 2,108 line items among the individual APL's.

Even as the correlation between the line items demanded and the line items allowed is low, this is only a part of the emerging picture. So, too, is there a preponderance of demand which is less than the APL allowed quantity. Part II of Tables II through XVI depicts this situation on the basis of the actual equipment operating hours. Collectively the 216 APL allowed line items demanded (combined total of identical and substitute item requests) were ordered in quantities less than the APL allowed quantity 84 per cent

of the time (recall, however, that the quantity demanded used in this analysis was the smoothed demanded quantity).

Part III of Tables II through XVI drives this point home convincingly even though the comparison is again made using smoothed quantities demanded because whereas Part II deals only with comparisons involving APL allowed line items having experienced demands, Part III shows all significant differences between APL allowances and quantities demanded (or not demanded) without regard to whether or not the item experienced any demand. A summary of the data contained in Part III of all fifteen tables shows 500 line items for which the demand quantity (smoothed) was significantly different from the APL allowed quantity and in 476 instances the APL allowed quantities were significantly greater than the demanded quantity. A detailed analysis of the composition of these 476 instances of significantly greater allowance quantities would show a redundancy of line items both in terms of identical identifications and also in terms of similar applications.

The author will not delve deeply into this analysis, but suffice it to say that among the most notable items showing significant differences are spark plugs and engine oil filters. Without exception, in all thirteen APL's covering forklifts having internal combustion engines these two items are conspicuous in the size of the difference between the quantity allowed and the quantity demanded. Other items

such as engine overhaul parts and other fluid filters are observed as appearing almost as consistently among the items having significantly greater allowance quantities than the quantities demanded. The significance of the presence of these items among those having allowance quantities substantially greater than demand should be readily apparent: these are the kinds of items that are utilized in the performance of scheduled routine maintenance actions which are in turn conducted at prescribed intervals based on equipment operating hours.

Referring back to Part II of Tables II through XVI to the projected effect of increased operating hours on the quantities of APL line items demanded, a summary of all fifteen such tables indicates the following: that whereas the quantity demanded is less than the APL allowed quantity 84 per cent of the time based on the actual equipment operating hours, the demand would be less than the APL quantity 62.5 per cent of the time were the operation of the equipments increased to an average of 1200 hours per year and the demand would be equal to or greater than the APL quantity 63 per cent of the time were the equipments operated an average of 2000 hours per year. The precision of the extrapolation is doubtful, as indicated earlier, but surely the overall lack of correlation between the APL allowance quantities and the quantities and range of

items demanded by the NSC Oakland forklifts has some significance which cries out for an explanation. The author believes that the explanation lies with the low equipment operating rates which in turn translate into low parts utilization rates. Because the applicable APL's are founded upon the rather vague criteria of a ninety day endurance level, the APL's lack the flexibility to accurately project parts usage rates except in situations where some undefined high level of equipment operations coincides with the ninety day projections. In this age of sophisticated systems analysis, we ought to be able to develop a formula which, by taking into account all the relevant variables such as operating hours in the case of forklifts, will generate reasonably accurate parts usage projections. From these projections allowance parts lists could be prepared which would serve as highly credible inventory planning guides.

D. OBSERVATIONS CONCERNING MASTER LISTINGS OF PARTS USAGE DATA

Appendix P is a consolidation of all the parts demanded by the 115 forklifts which generated demands and which were specifically provisioned by APL's. Appendix Q is the total annual usage data generated by all of the forklifts on the NSC Oakland MHE allowance. Both appendices indicate degrees of the same phenomenon: PWC's extensive use of certain items which their experience has shown to be interchangeable among the majority of the forklifts supported. The author will not attempt to comment on the technical aspects of this

interchangeability as he is not qualified to do so. Suffice it to say that the PWC transportation maintenance section has ascertained that an acceptable level of interchangeability exists among these particular parts and the parts actually prescribed for use. The advantages reaped from this knowledge are intuitively obvious: less line items required in inventory thus facilitating better inventory control. The author envisions that other activities having similarly diverse populations of forklifts might benefit from the parts commonality data contained in Appendices P and Q. In the brief list to follow are some of the line items exhibiting this commonality of usage. A comparison with the APL's shows that some of the items presently appear in one or more of the APL's, but that additionally the items experience demand from equipments covered by at least three APL's in which the item is not cited by the specific National Stock Number. If the interchangeability is as real as it is apparent, then perhaps more APL's in the future can be prepared reflecting increased standardization of parts among APL's thus giving this data widespread dissemination. Among the parts prominently demonstrating this widespread interchangeability are the following:

Bearing, Ball, Annular	3110-00-144-8589
Spark Plug	2920-00-540-7539
Regulator, Engine Gen	2920-00-561-8376

IV. CONCLUSIONS

A. VALIDITY OF FORKLIFT APL'S AS A PLANNING DOCUMENT

From days gone by when the author lamented the failure of APL's to project adequate ranges and depths of repair parts support, this research effort has led the author to see the other side of the coin. It can be truly said that while the APL's applicable to the 130 forklifts at NSC Oakland do not provide for every requirement which is generated, they do provide quite abundantly in quantities those items which are allowed. Unfortunately this abundance in quantity is scarcely more to be desired than is a situation of shortage. In an era when shrewd financial management of resources is a matter of concern within every component of the Department of Defense, when a watchful Congress and an attentive public are quick to rebuke the military services for wasteful practices and inefficient management, it behooves every manager of military-owned inventories to manage his inventories prudently and to invest his limited funds in those items which can be reasonably expected to satisfy a pattern of recurring demands. An allowance parts list should provide such a manager with an invaluable planning tool by which to determine which items and in what quantities to include in his stocks. Regrettably the allowance parts lists for the forklifts at NSC Oakland would not

be of help to the manager attempting to develop his support of the forklifts based on these documents. In fact, for him to rely on them for this purpose would be disastrous in terms of the funds indefinitely and inextricably invested in these allowance items. The author recognizes the desirability of including items of an "insurance" nature in allowance planning documents and no doubt a number of the non-moving items on the APL's involved in this study were specifically incorporated in the APL's to provide this insurance coverage. Nonetheless, the numbers of line items experiencing no demands and the numbers of items having allowed quantities significantly greater than the quantities actually demanded cannot be explained by mere reference to the inclusion of some insurance items in the APL's, for it is no doubt true that the insurance items contribute at most only insignificantly to this situation. It all boils down to the fact that the APL's were not designed (and perhaps were never intended) to extensively adjust the scope of their coverage to retain their reliability as a planning support document in situations of low operating hours as well as high operating hours. Without the flexibility to be applied to a range of operating situations, however, the APL cannot reasonably be expected to serve as a credible planning document. Perhaps if the variables involved in the formulation of allowance parts lists were more explicitly stated, an activity having such an APL could use it as a starting point for determining its own local stocking policy.

Placing matters in perspective, the author recognizes that no matter how good or bad APL's for forklifts might be, the dollar value of the associated inventory which they represent is an insignificant amount when compared to overall Navy expenditures for inventories in support of its assets. Nonetheless, for the inventory manager at the local activity level, judicious allocation of his limited operating funds in inventory support of his operation is a matter of continuing concern to him. APL's are intended to assist him in this endeavor and, where APL's can be improved in meeting this objective, the author believes that such should be done. It is the author's opinion that APL's for forklifts are an instance where improvement is needed and where the capability exists to collect and analyze the data in achieving this needed improvement.

B. RECOMMENDATIONS

It is not the author's intention to condemn the basic concept of the APL nor to belittle the efforts of those who have conceived it, developed it, and brought it to the point of refinement at which it serves admirably as a planning document in those particular situations conforming to a certain degree of sustained equipment operations. The author firmly believes that the usefulness of the APL can be immeasurably increased such that the APL can be reasonably applicable to the most diverse operating situations. To

achieve this goal the author recommends the establishment of a comprehensive program designed to capture and evaluate repair parts failure/replacement data in order to ascertain the mean time in equipment operating hours between failures for each item. From this data plus the data relative to the scheduled maintenance actions could conceivably be developed a highly reliable support planning document based on equipment operating hours.

In addition, it is recommended that further studies be done in this area to develop adequate analytical techniques to evaluate the relationship between the variables which impinge upon rates of repair parts usage.

KEY TO THE APPENDICES

PART NUMBER	- Part number of item demanded, blank in many instances where National Stock Numbers are used.
NATL STOCK NR	- National Stock Number of item demanded, blank in many instances where Part Numbers are used.
QTY	- Quantity of item ordered by indicated transaction.
U/I	- Unit of issue of the item demanded.
DATE REQD	- Julian date and serial number identifying the specific order action. The last four digits are non significant when "0000" appears.
ACT	- Action code signifying that item was issued from PWC shops stores when "I" is used and that item was ordered from commercial and, occasionally, military sources when "O" is used.
USN NR	- USN registration number of equipment for which demanded item was acquired.
MANU	- Code identifying the manufacturer of the forklift for which the item was demanded. Codes utilized are as follow: AC Allis-Chalmers Mfg. Co. BA Baker Industrial Trucks Div., Otis Elevator Co. BC Barrett-Cravens Co. CL Clark Equipment Co. HY Hyster Co. MO Moto-Truc Co. RA Raymond Corp. SH Silent Hoist and Crane Co., Inc. TO Towmotor Corp.

MOD

- Code identifying the manufacturer's model number of the forklift for which the item was demanded. Codes utilized are as follows:

A2 F60PS
A3 ACE-20-A
A4 FE30-24
A5 ACP-40-PS
B1 FJF060
B2 FJD040
B3 FJD060
B5 FSHG-20-48
B6 FTA-030-EE

R2 E4RTN
R4 902-E4RTN
S1 FK-15
T1 501-P-RS
T2 462SG4024
T4 W20

CAP

- Indicates forklift rated capacity in thousands (K) of pounds

APL

- Indicates the last four digits (understood to be preceded by the digits 95000) of the allowance parts list, when such exists, which applies to the equipment for which the item was demanded.
